N_d Datasets for Observational Constraint

Satellite Observations:

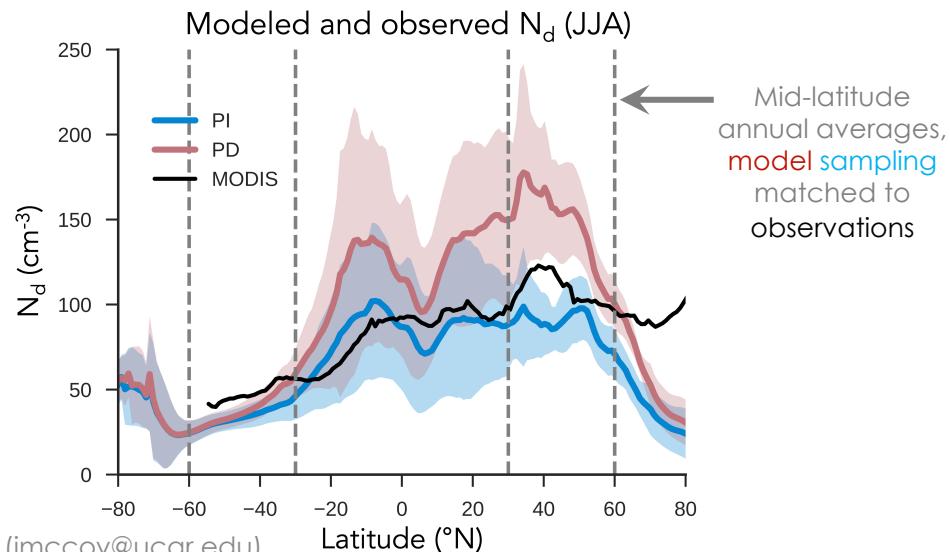

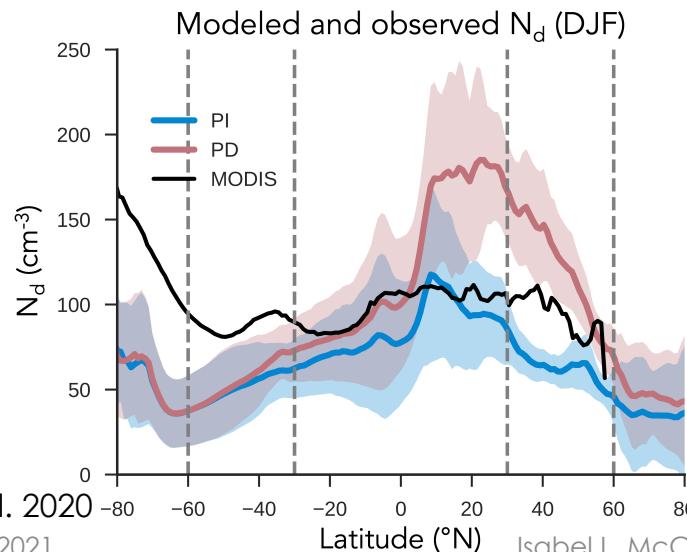

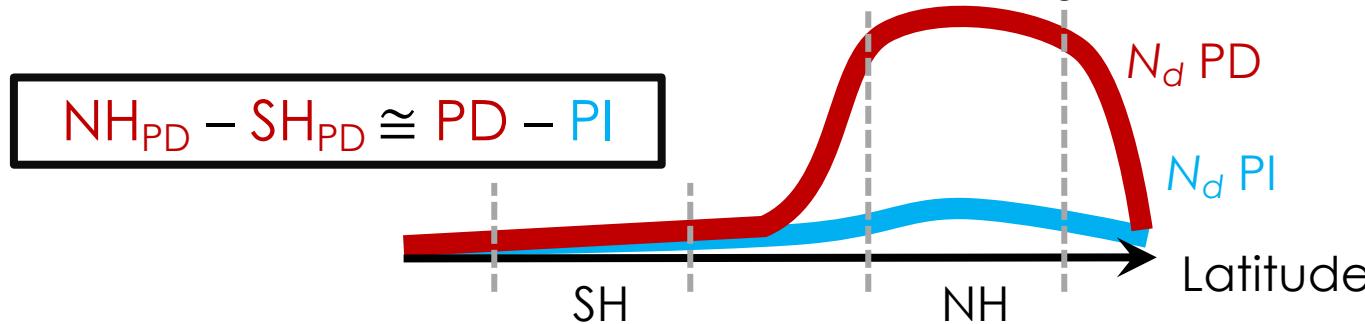

- **MODIS** Aqua 2003-2015 (Grosvenor and Wood 2014)

Models:

- **Aerocom phase II indirect 3:** CAM5, CAM5-CLUBB, CAM5-MG2, CAM5-CLUBB-MG2, ECHAM6.1.0-HAM2.2, SPRINTARS, and SPRINTARSKK
- Sensitivity studies in **HadGEM3-GA6 to 7.1** (Mulcahy et al. 2018)
- **Perturbed Parameter Ensemble (PPE) from HadGEM-GA4-UKCA** with 26 aerosol process, emission and deposition parameters simultaneously perturbed (Collins et al., 2010, Yoshioka et al., 2019). Emulation of PPE members as in Watson-Parris et al. 2019.

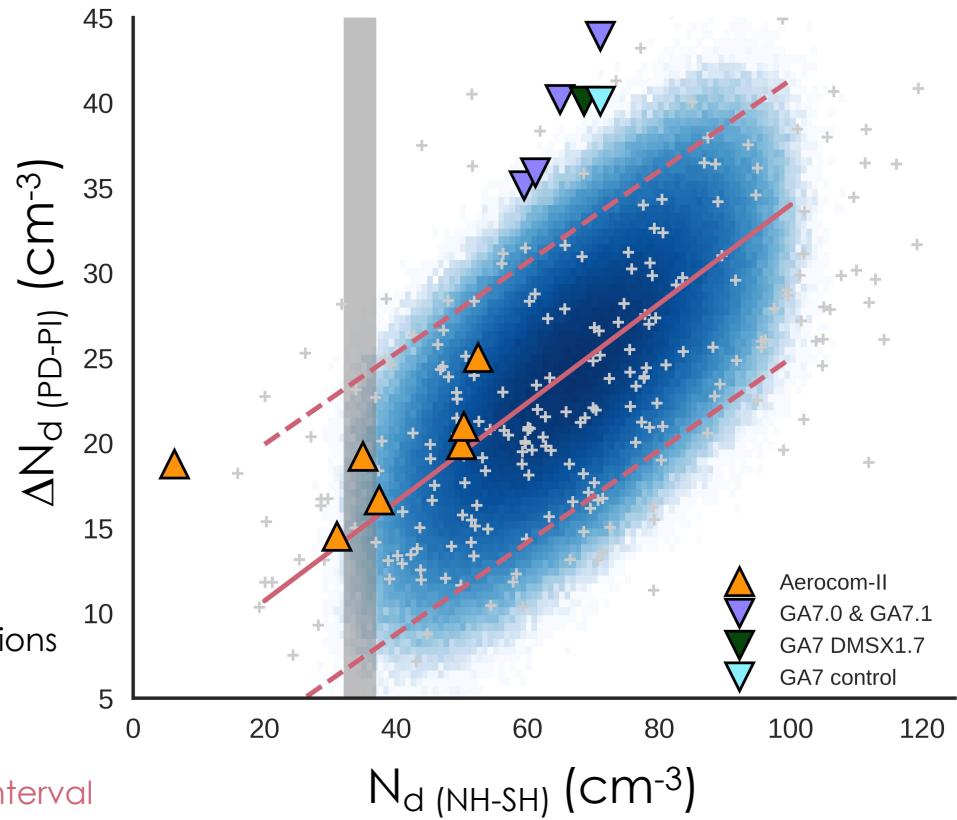

How can we use present day N_d to constrain RF_{aci}?

Does $\text{NH}_{\text{PD}} - \text{SH}_{\text{PD}} \approx \text{PD} - \text{PI}$?

Yes, the hemispheric contrast contains information about the change in N_d from the pre-industrial.

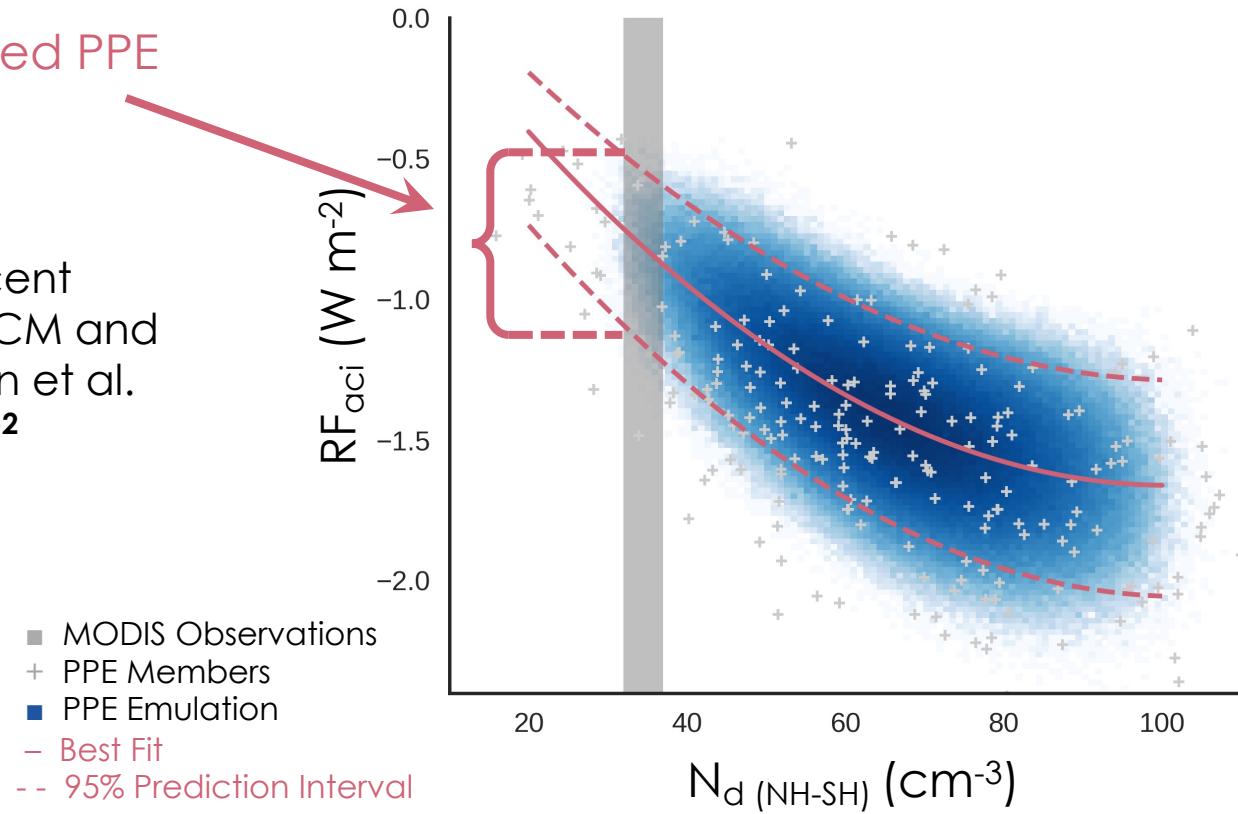

- MODIS Observations
- + PPE Members
- PPE Emulation
- Best Fit
- 95% Prediction Interval

Can we constrain RF_{aci} with N_d (NH-SH)?

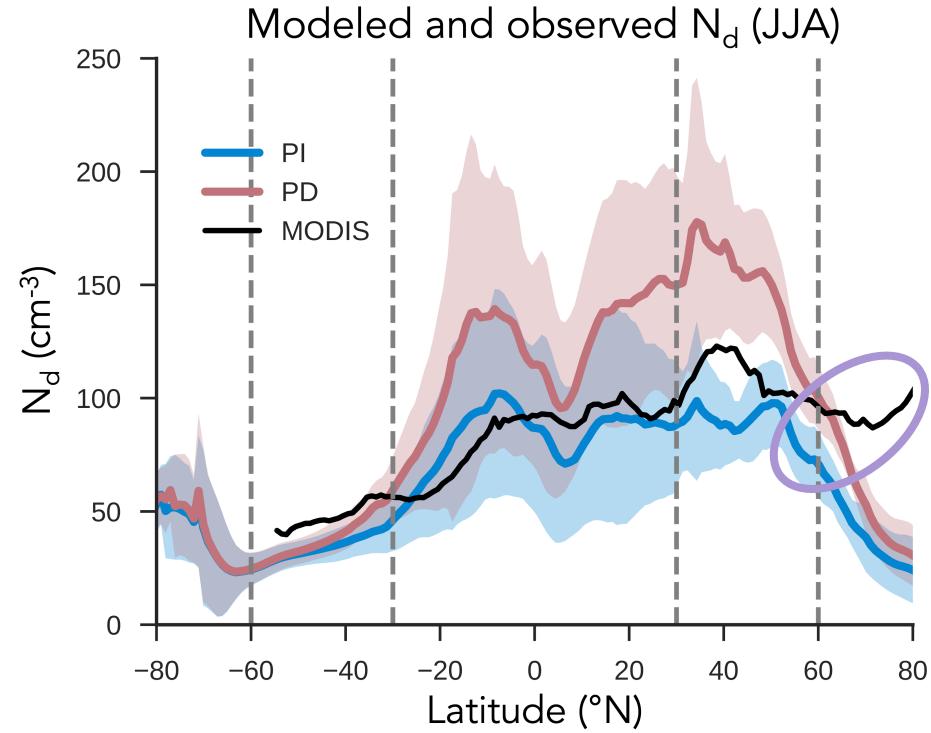

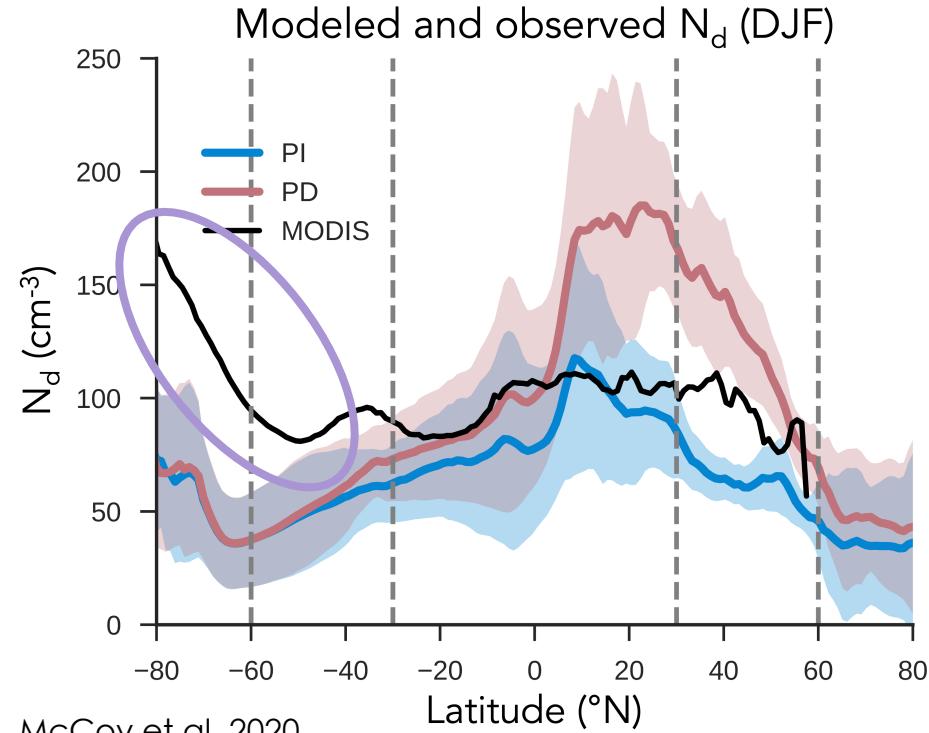

The MODIS constrained PPE
 RF_{aci} range is:
-1.20 to -0.60 W m^{-2}

Comparable to the recent
synthesis range from GCM and
remote sensing (Bellouin et al.
2019): **-1.2 to -0.35 W m^{-2}**

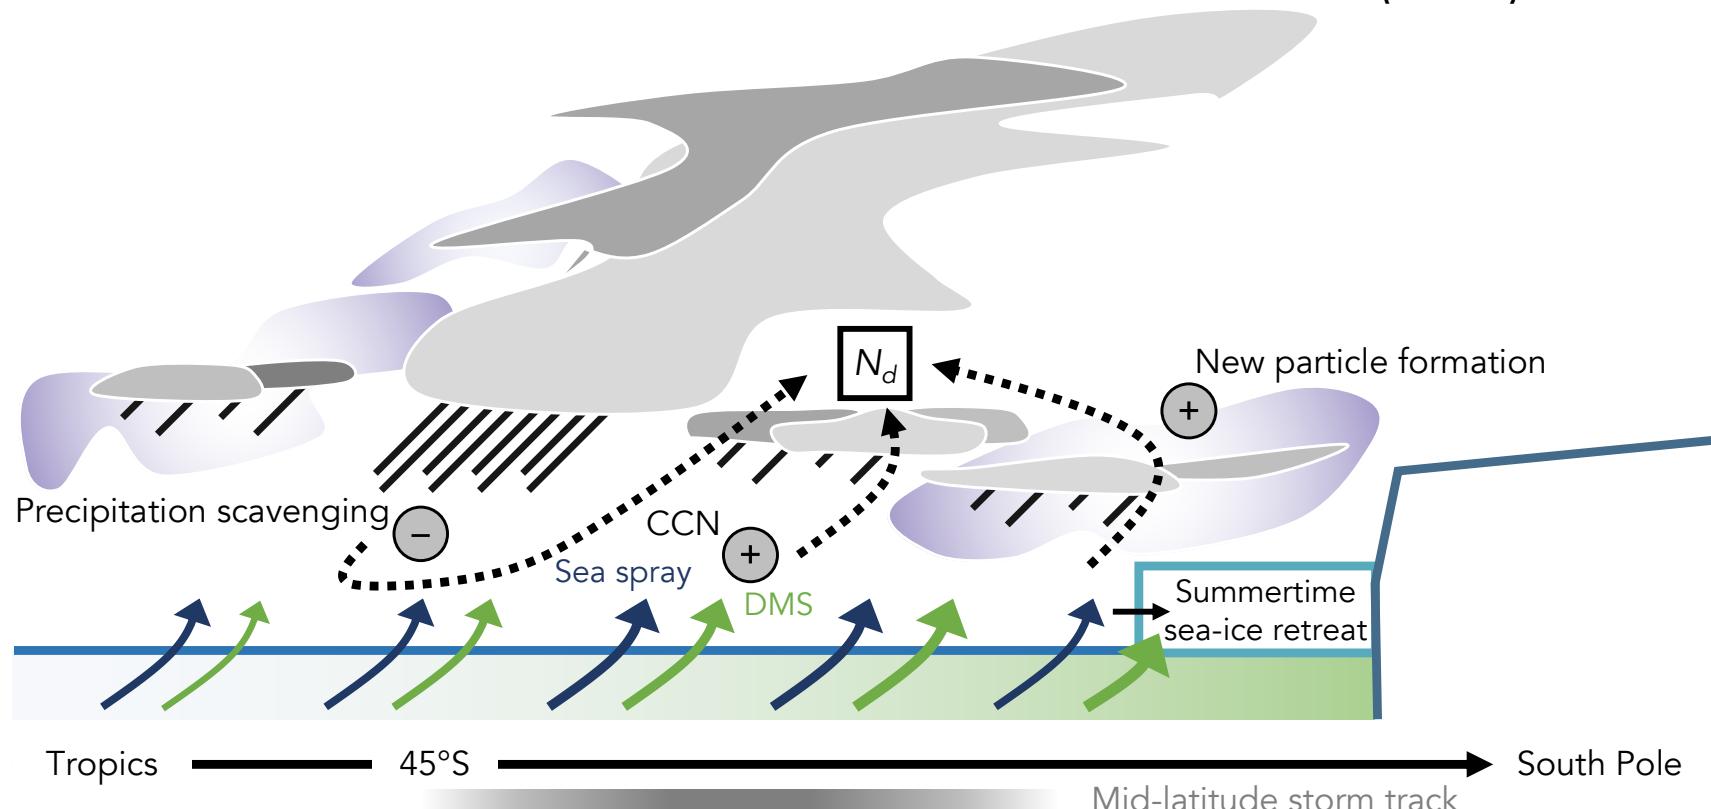

Why are so many models and PPE members outside of the observed range of N_d (NH-SH)?

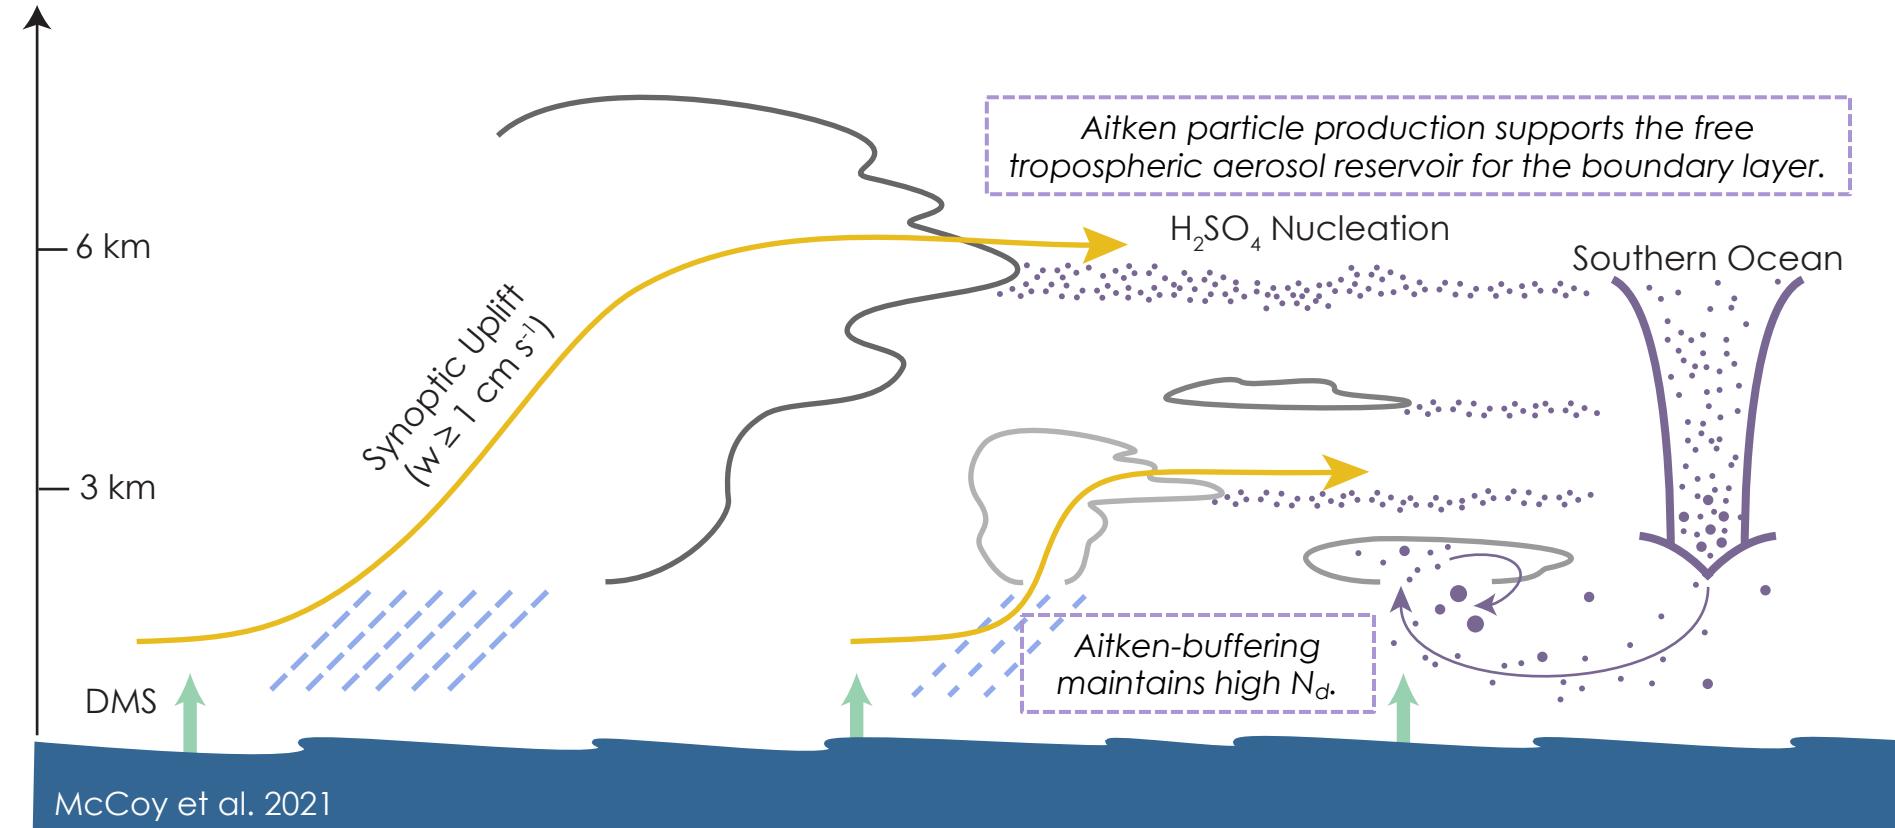

Summertime mid-latitude N_d is too low in models.

Uncertainty in aerosol indirect forcing is dominated by uncertainty in the pre-industrial aerosol state (i.e. natural emissions) (Carslaw et al. 2013). Natural emissions control Southern Ocean cloud condensation nuclei (CCN).

In-situ sampling of SO aerosol-cloud interactions reveals underprediction of small particles critical for N_d

McCoy et al. 2021

Isabel L. McCoy (imccoy@ucar.edu)

Summary

- The hemispheric contrast in cloud droplet number concentration (N_d) can be used to constrain ΔN_d (PD-PI), RF_{aci} .
- N_d in pristine, biologically active environments is underpredicted in GCMs.
- *In situ* sampling of aerosol-cloud interactions in these environments reveal critical mechanisms for N_d .
