

# Learning from ocean color: bio-physical interactions

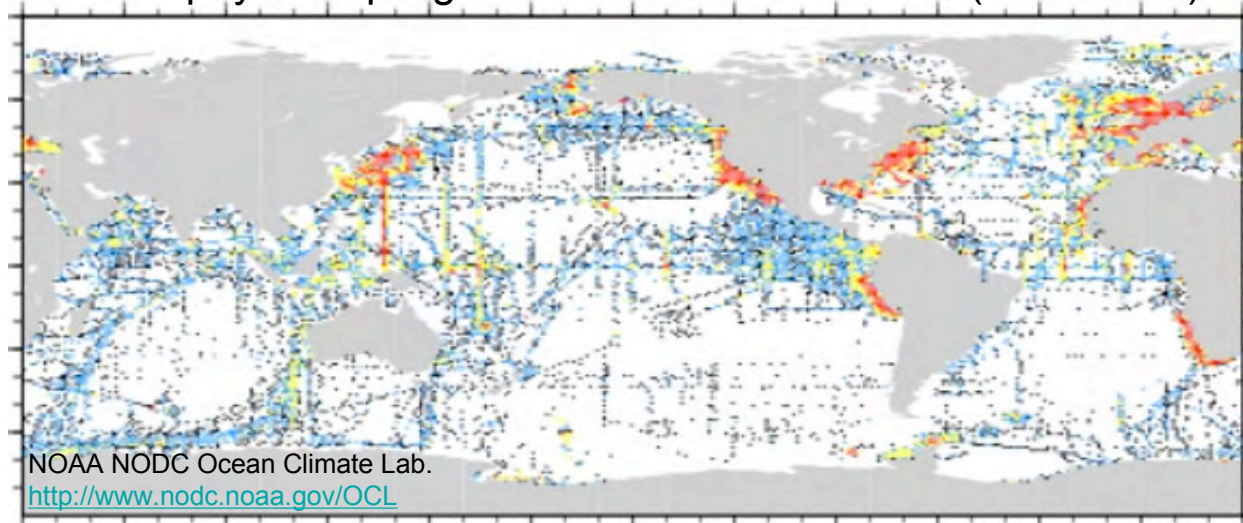

Laure Resplandy  
LOCEAN - University of Paris

GIFT 2009, Vienna

Picture: Envisat, Meris (ESA)

# Why is satellite attractive for ocean survey?

Chlorophyll sampling in World Ocean Database (1929-2008)

Number of samples in box of ~100km x 100km

- Ocean sampling: need a ship => expensive
- No global coverage
- Asynoptic view: no view of very large areas of the world in a very short time  
cruises limited in time and space

→ Satellites give global view in a very short time

# What color is the ocean?

Blue ... and green!

- Green = phytoplankton pigment  
=> chlorophyll
- The more phytoplankton the greener  
=> relation color & chlorophyll
- Some satellites see ocean colors  
=> chlorophyll concentration

Diatoms  
(phytoplankton)

Bradbury J.

10µm

## How does it work?

**SeaWiFS samples 8 wavelength**  
**Meris (15), Modis (36)**

## How does it work?

**SeaWiFS samples 8 wavelength  
Meris (15), Modis (36)**

1. colors are recombined

**“true color”:**

how human eye would view the scene

## How does it work?

**SeaWiFS samples 8 wavelength  
Meris (15), Modis (36)**

1. colors are recombined

**“true color”:**

how human eye would view the scene from an altitude of 705 km

2. from color to  
chlorophyll concentration

**chlorophyll  
concentration**

or

**phytoplankton  
concentration**

# How are the data we get?

SeaWiFS covers the globe  
in 2 days

but

problem of cloud cover

SeaWiFS daily coverage

SeaWiFS Chlorophyll a

11 OCT 1997

NASA/GSFC

Weekly composite to get  
a better coverage

SeaWiFS weekly coverage

SeaWiFS Chlorophyll a

08 OCT 1997 To 15 OCT 1997

NASA/GSFC

# An important fact about chlorophyll observations

In real world: data

● In-situ data

- Ocean color satellites only see the surface ... or the clouds
- In-situ data are sparse

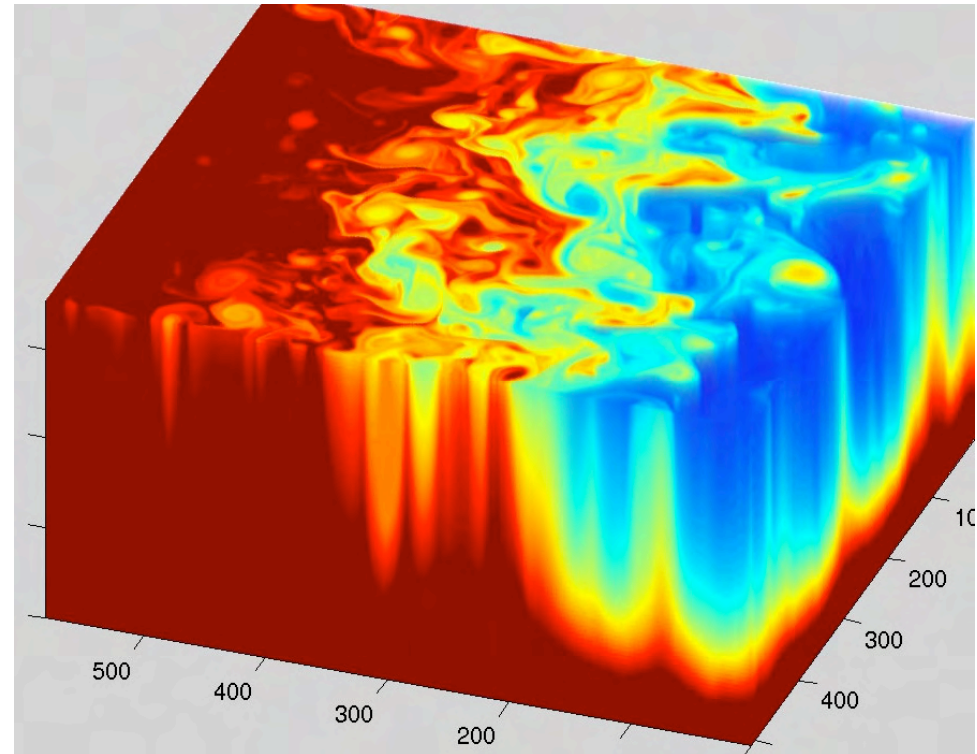

# An important fact about chlorophyll observations

In real world: data

● In-situ data

In model world

Guillaume Lapeyre <http://www.lmd.ens.fr/glapeyre/ocean/index.html>

- Ocean color satellites only see the surface ... or the clouds
- In-situ data are sparse

⇒ Models help reconstruct the gaps and understand the processes

# Global **surface** chlorophyll map

Chlorophyll - phytoplankton distribution is not homogeneous

=> *What does phytoplankton need?*

# What does phytoplankton need?

↳ nutrients

# What does phytoplankton need?

↳ nutrients + light

Light

No  
Light

Ocean  
depth

Vertical section of nutrients in North Atlantic Ocean

# What does phytoplankton need?

↳ nutrients + light

B phytoplankton

phytoplankton A

Light

No Light

Ocean depth

Vertical section of nutrients in North Atlantic Ocean

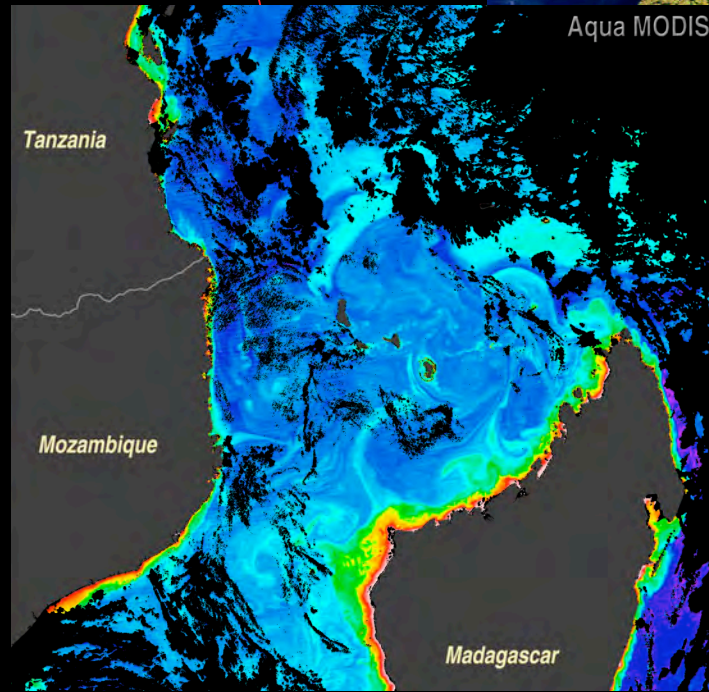

# Global **surface** chlorophyll map

**Large scale** chlorophyll patterns comes from distribution of light and nutrients  
i.e. ocean circulation = physics!

*What happens if we look closer? ... at **small scale***

# Chlorophyll organized in small scale structures

# Chlorophyll spatial distribution at different scales

~ 1000 km  
Global circulation

Large scale

# Chlorophyll spatial distribution at different scales

~ 1000 km  
Global circulation

~ 100 km  
Eddies

Large scale

~ 1000 km  
Global circulation

~ 100 km  
Eddies

~ 1-10 km  
Filaments

Large scale

Small-scale

A satellite image of the Norwegian coast, showing a complex pattern of small-scale chlorophyll structure. The water is a deep blue-green color, with intricate, swirling patterns of lighter and darker shades of green and blue. The patterns are highly detailed and appear to be influenced by coastal features and ocean currents. The landmass of Norway is visible on the left side of the image, with a white coastline. The word "Norway" is written in white text at the bottom right of the image.

What can explain small-scale structure in chlorophyll?

Norway

Ocean Temperature

Chlorophyll

Relation chlorophyll - temperature  
=> bio-physical interactions?

# Why do we talk about bio-physical interactions?

# Why do we talk about bio-physical interactions?

# Why do we talk about bio-physical interactions?

Phytoplankton and chlorophyll associated with cold temperature

# Small-scale mechanisms that shape chlorophyll?

1. Small-scale transports chlorophyll
2. Small-scale re-organizes chlorophyll
3. Small-scale is an ocean fertilizer  
⇒ bring nutrients to the surface

# 1. Small-scale transports chlorophyll

Inside **eddies** or **filaments**, water is “**isolated**”  
=> Water mass properties (temperature, chlorophyll...) can **travel for month**

⇒ *Horizontal process*

## 2. Small-scale re-organized large-scale gradients

To reconstruct the evolution of chlorophyll we use **high resolution model**:

### 3. Small-scale re-organized large-scale gradients

To reconstruct the evolution of chlorophyll we use **high resolution model**:

⇒ *Horizontal process*

### 3. Small-scale = ocean fertilizer

Northern hemisphere

Anti-cyclonic

Cyclonic

Eddy **poor** in chlorophyll

Eddy **rich** in chlorophyll

### 3. Small-scale = ocean fertilizer

anti-cyclonic eddy

cyclonic eddy

light nutrients

⇒ vertical process

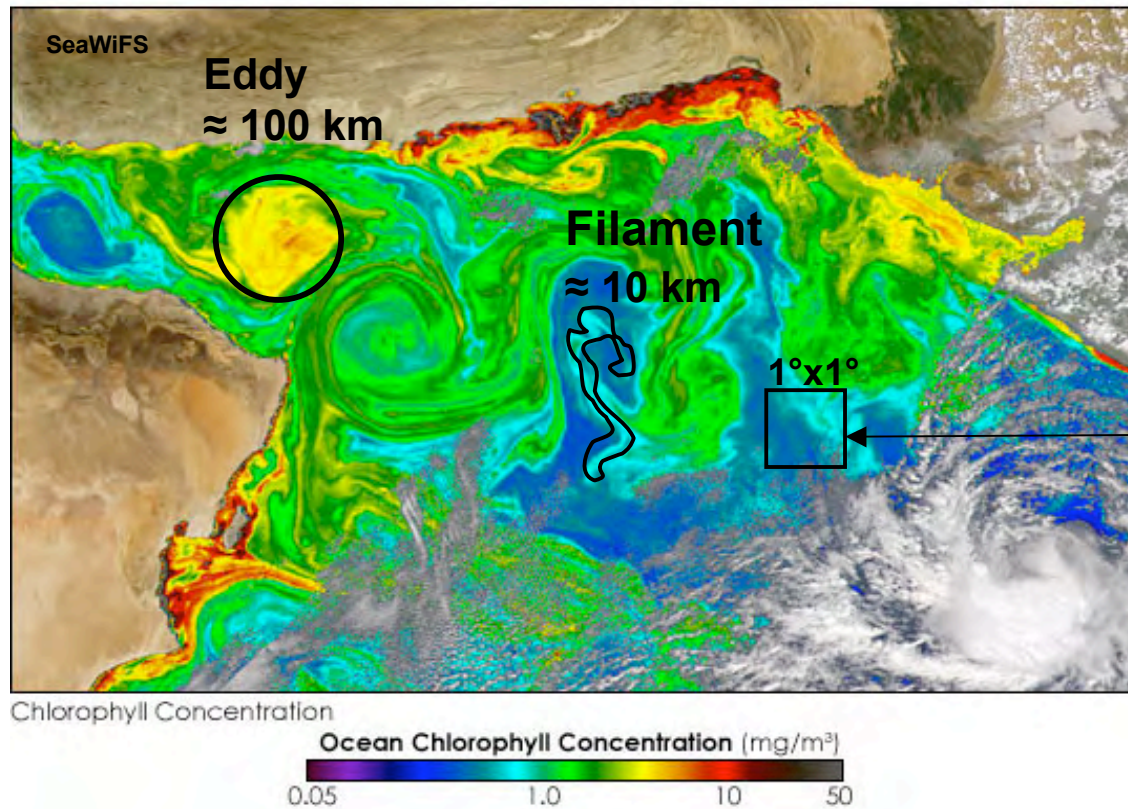

# Do we need **small-scale** to understand the **global** picture?

Carbon cycle in climate models:

Phytoplankton plays a role in carbon cycle

# Do we need **small-scale** to understand the **global** picture?

Climate model  
≈ 100 x 100 km  
Simulations 1000 years

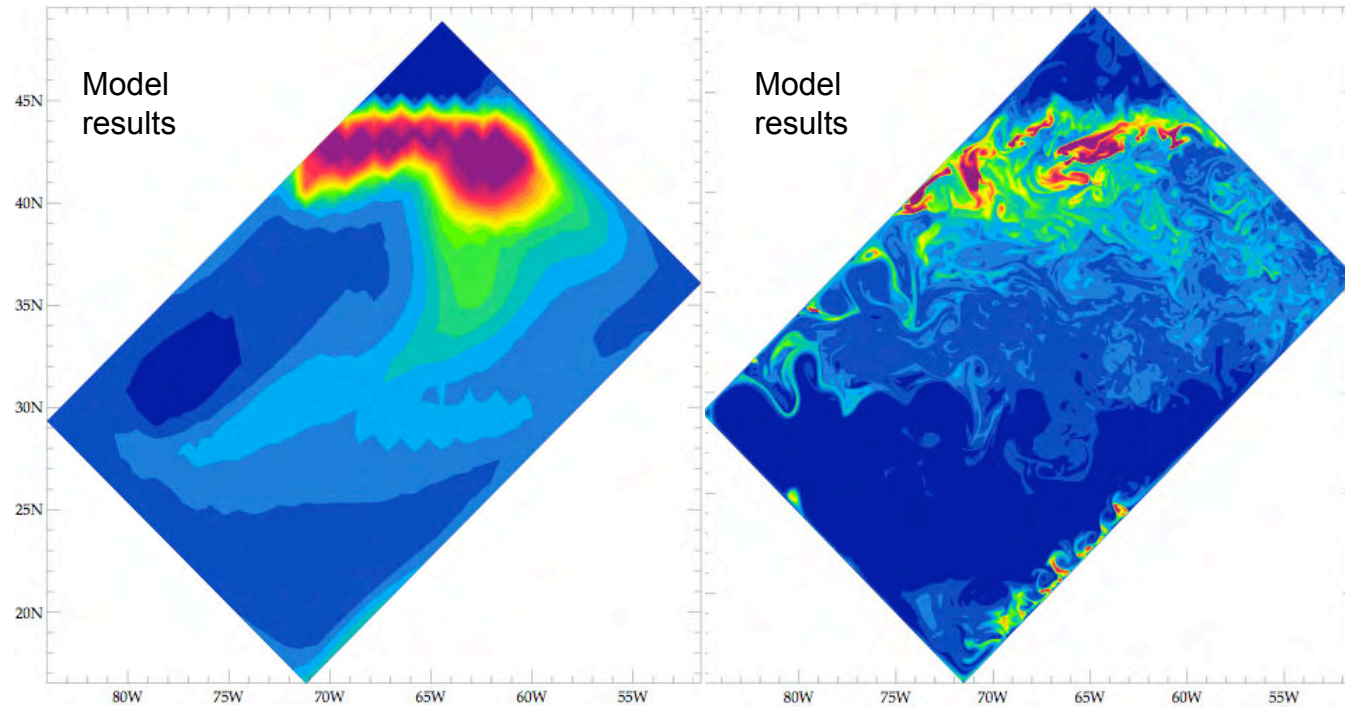

Climate models can not simulate small-scale (computers limit)  
Need of **high resolution bio-physical models to quantify the impact**

# 1. Modelling study: “Gulf Stream”

~ Climate model resolution  
100 km

High resolution  
2 km

Lévy et al. (in prep.)

*chlorophyll decreases*

## 2. Modelling study: Arabian Sea

Satellite  
data

Intermediate resolution  
25 km

1m/s

High resolution  
8 km

Resplandy et al. (in prep.)

***chlorophyll increases***

### 3. Modelling study: offshore Portugal

~ Climate model resolution  
100 km

Intermediate resolution  
25 km

High resolution  
5 km

Resplandy et al. (2009)

*chlorophyll does not change but is re-organized*

A satellite image of the Indian Ocean, showing a complex pattern of ocean currents and eddies. The colors range from light blue to dark blue, indicating different water masses and temperatures. The image is centered on the Indian subcontinent and the surrounding ocean.

Do we need small-scale  
to understand the global?

At the end, it depends on the  
region and the ocean physics in it.

# Summary

- Satellites see ocean colors
  - ⇒ chlorophyll concentration
  - ⇒ estimation of phytoplankton i.e. biological ecosystems
- Chlorophyll structured from large scale to small-scale by physical processes
- From ocean color, small-scale appears as a horizontal process ... but also vertical process

Bio-physical  
interactions

- We can not understand ocean biology without looking at physics
- Looking at biology helps understanding physics
