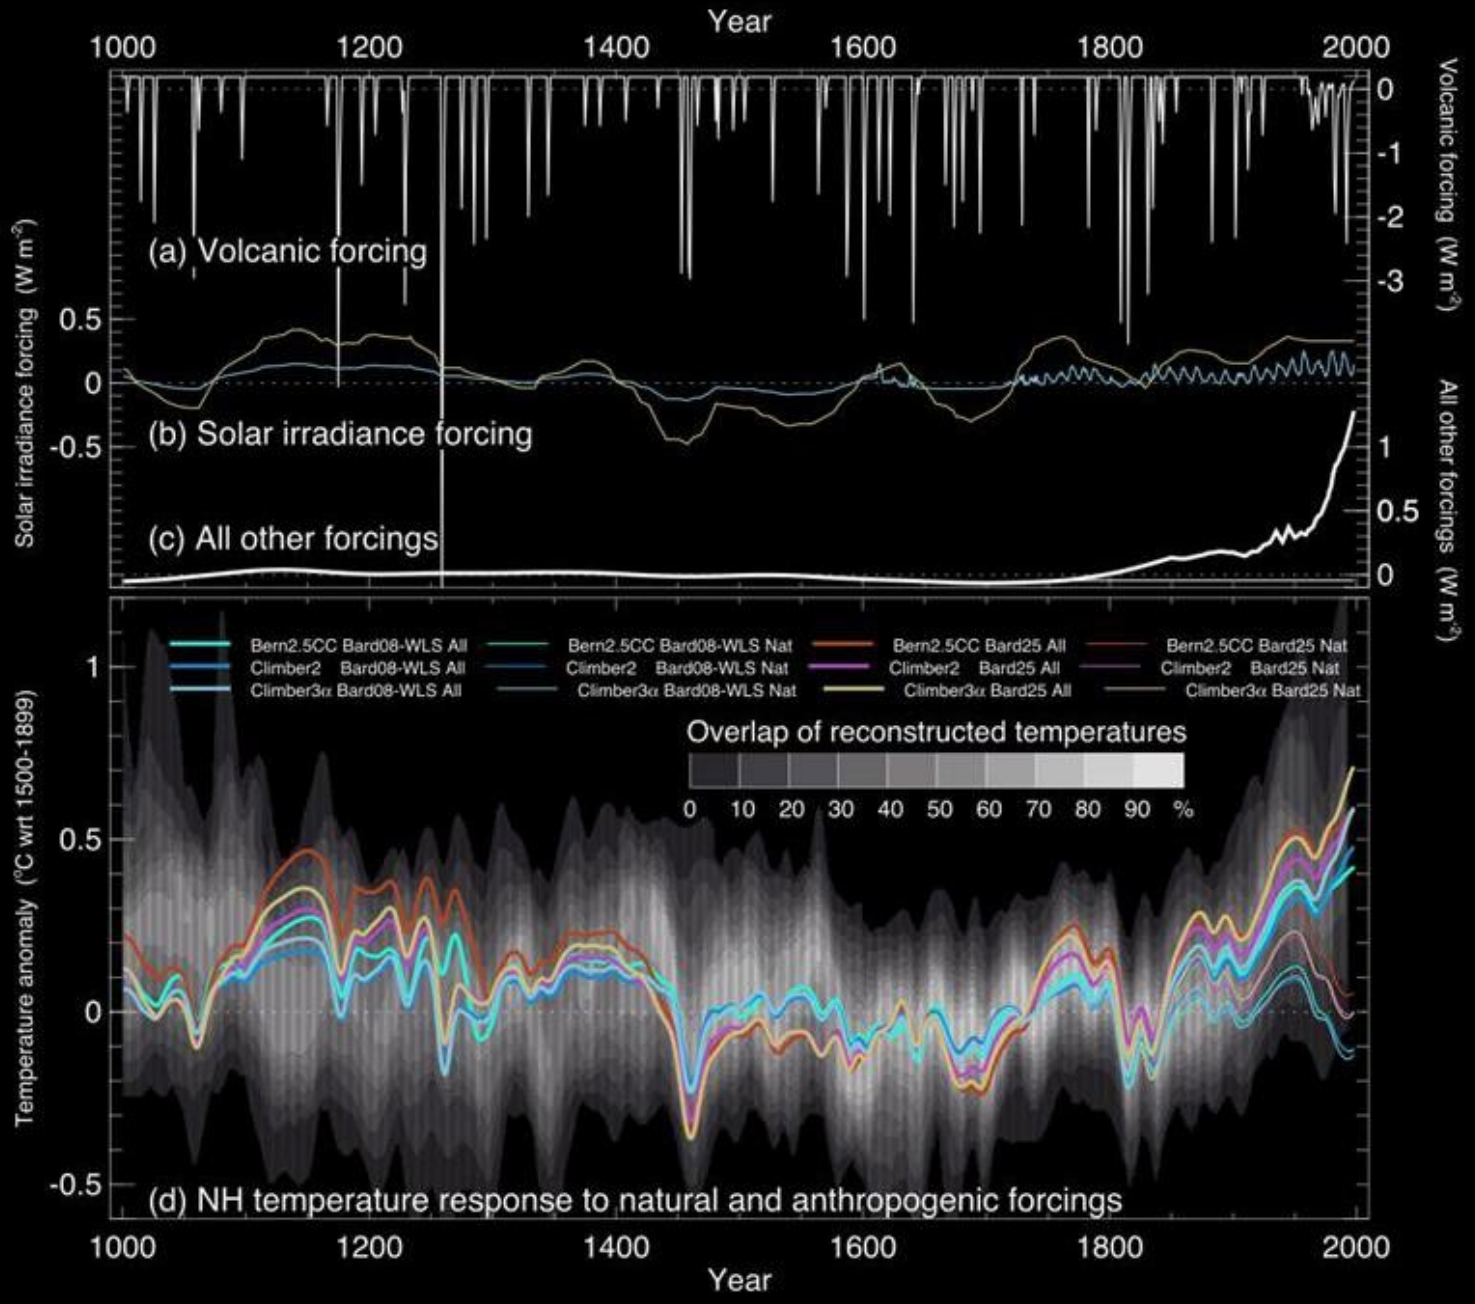
Volcanic aerosols improve our knowledge of the climate of the past

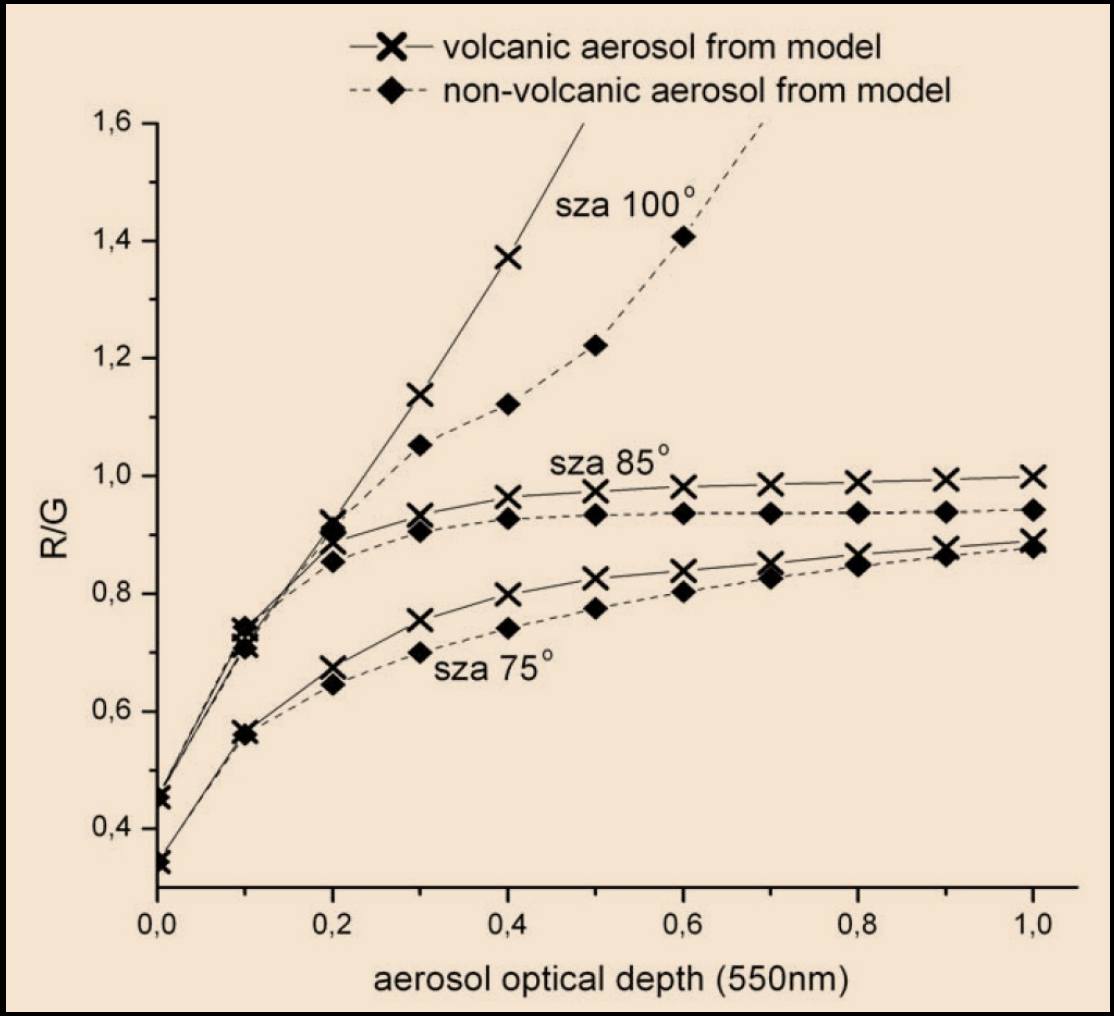


The volcano Tambora, in 1815, created the «Year Without Summer» (1816)

"Darkness" by Lord Byron (1788-1824)

I had a dream, which was not all a dream.
The bright sun was extinguish'd, and the stars
Did wander darkling in the eternal space,
Rayless, and pathless, and the icy earth
Swung blind and blackening in the moonless air;
Morn came and went—and came, and brought no day,
And men forgot their passions in the dread
Of this their desolation; and all hearts
Were chill'd into a selfish prayer for light:
And they did live by watchfires—and the thrones,
The palaces of crowned kings—the huts,
The habitations of all things which dwell,
Were burnt for beacons; cities were consumed,
And men were gather'd round their blazing homes
To look once more into each other's face; . . .

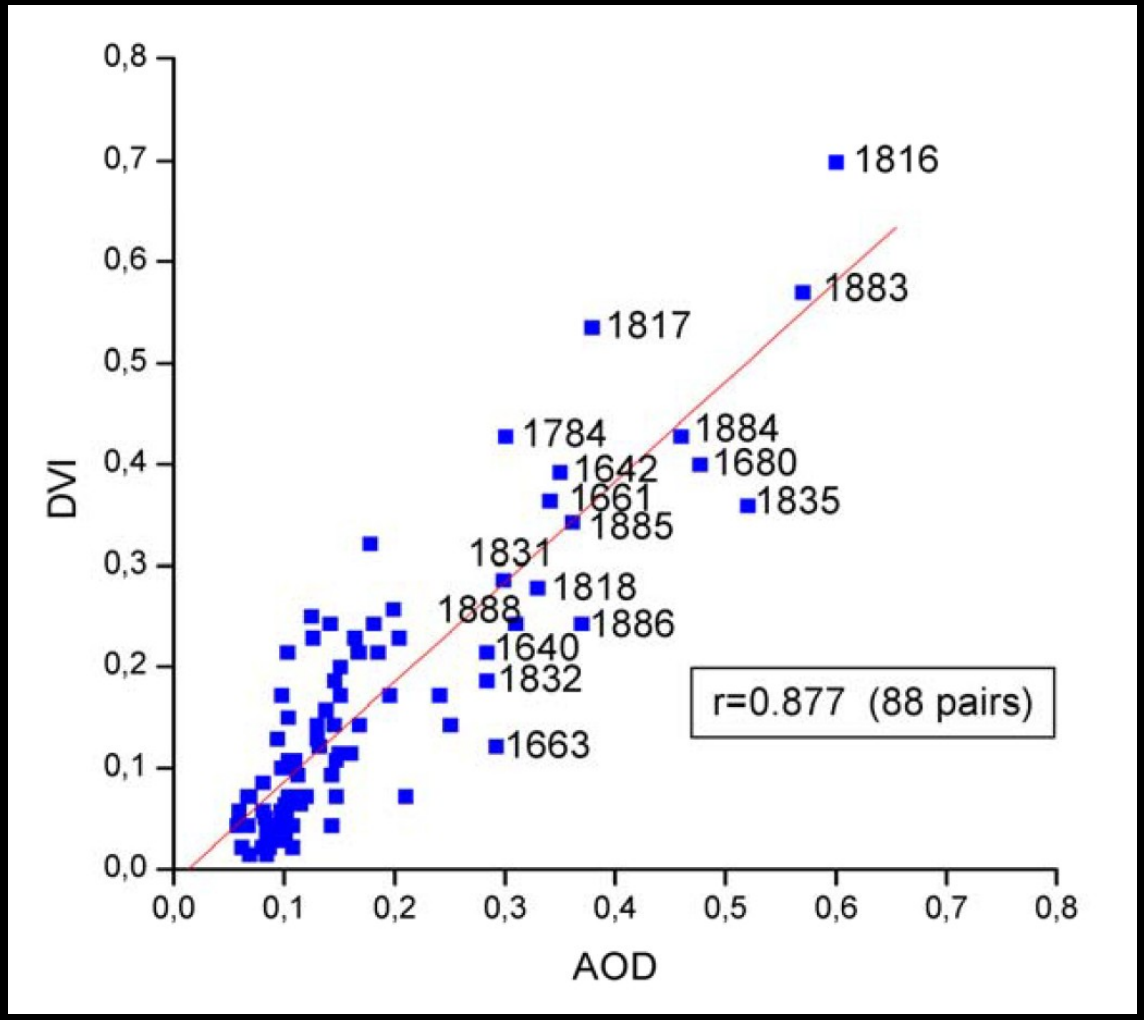
Nomogramm of R/G and aerosol optical depth as resulted from the model for three solar zenith angles calculated for non-volcanic and volcanic aerosols used to calibrate the measurements on paintings



Estimated aerosol optical depth at 550 nm corresponding to middle latitudes for each major volcanic eruption from this paper in comparison with other studies

	Volcano Name	Year of the eruption	AOD this study	Nearest estimate from other studies
1	Awu	1641	0.35	0.33 (Zielinski, 2000)
2	Katla	1660	0.29–0.34	N/A
3	Tongkoko & Krakatau	1680	0.47	N/A
4	Laki	1783	0.30	0.21–0.28 (Robertson et al.,2001) 0.19 (Robock and Free, 1996) 0.12 (Zielinski, 2000)
5	Tambora	1815	0.33–0.60	0.5 (Robertson et al., 2001) 0.5 (Robock and Free, 1996) 0.2–0.9 (Stothers, 1996)
6	Babuyan	1831	0.28–0.29	0.24 (Zielinski, 2000)
7	Coseguina	1835	0.52	0.11–0.21 (Robertson et al., 2000)
8	Krakatau	1883	0.37-0.57	0.6 (Deirmendijian, 1973)

Linear correlation between annual mean aerosol optical depth at 550 nm, estimated from sunset paintings following volcanic eruptions, and mean annual values of DVI. The errors in the AOD are less than 0.05 for values around 0.1 and can be up to 0.18 for AOD values greater than 0.5.



Error in AOD estimates derived from the average R/G variability within a painting (±0.014)

Solar Zenith angle	AOD	Error
75	0.1	< 0.05
	0.5	0.06 to 0.12
85	0.1	< 0.05
	0.5	0.1 to 0.18

Error in AOD estimates derived from a typical error in estimating the SZA in a painting within ±2°

Solar Zenith angle	AOD	Error
75	0.1	< 0.05
	0.5	0.07
85	0.1	< 0.05
	0.5	< 0.05

R/G ratios in the painting "Sunset"

R/G ratio and respective AOD (Unknown volcano ~1809)

Plate 19 John Constable, *Dedham Vale*, 1810. Private collection

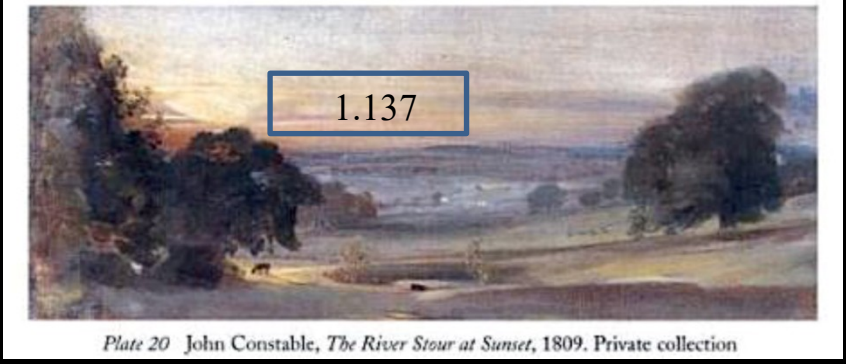


Plate 20 John Constable, *The River Stour at Sunset*, 1809. Private collection

1810
R/G ratio = 1.021
AOD ≈ 0.22

1809
R/G ratio = 1.137
AOD ≈ 0.30

Thornes, J.E., "John Constable's Skies: A Fusion of Art and Science", University Press, 1999

"Evening", 1824, Kunsthalle, Manheim, Γερμανία

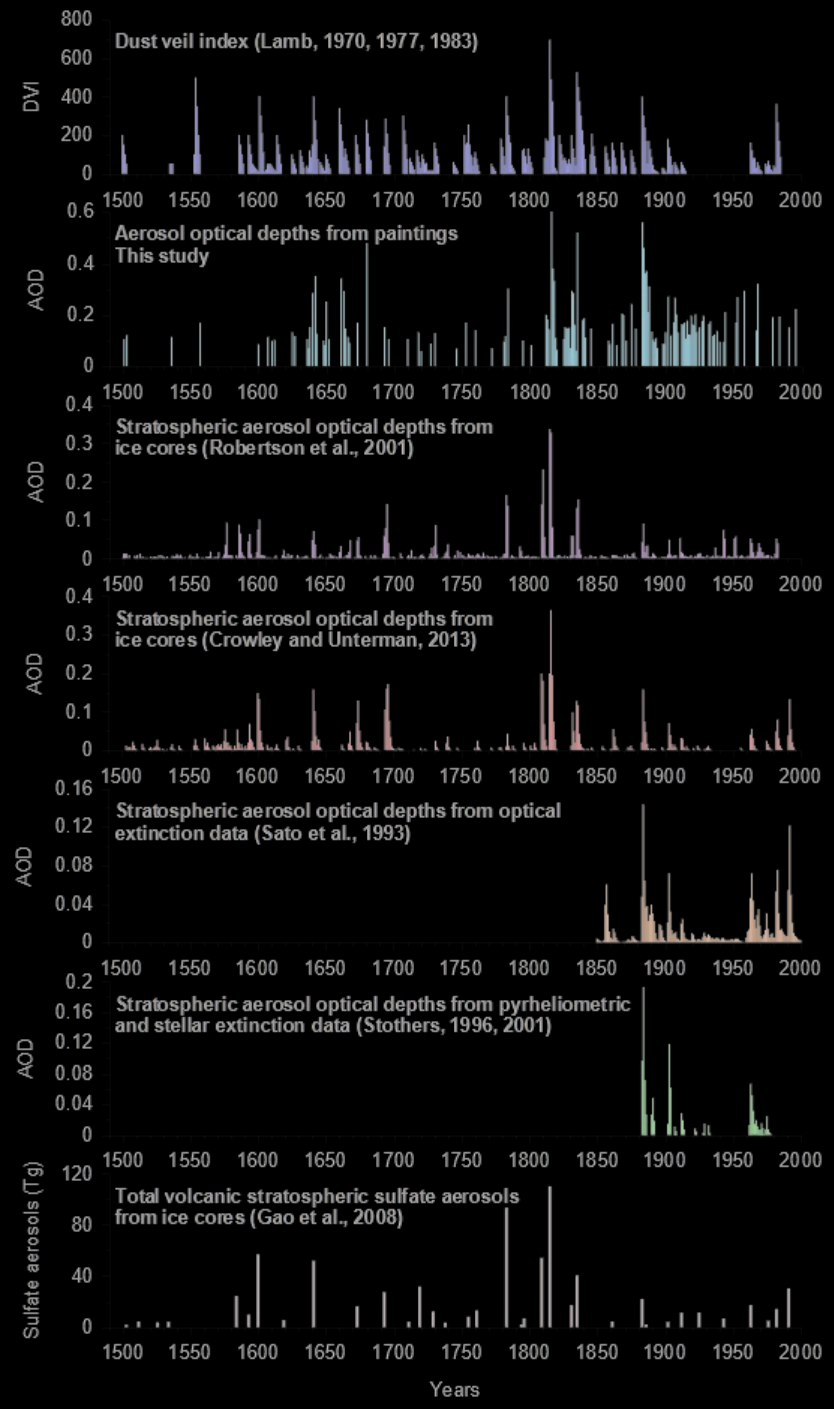
J.M.W. Turner (1775-1851)

Sunset after Babuyan

"Sunset", 1833, Tate Gallery

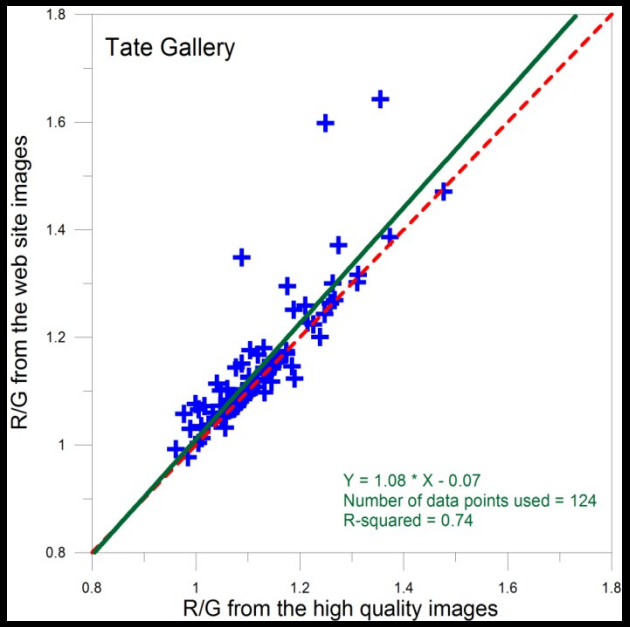
Sunset without volcano

«Chichester Canal», 1828, Tate Gallery

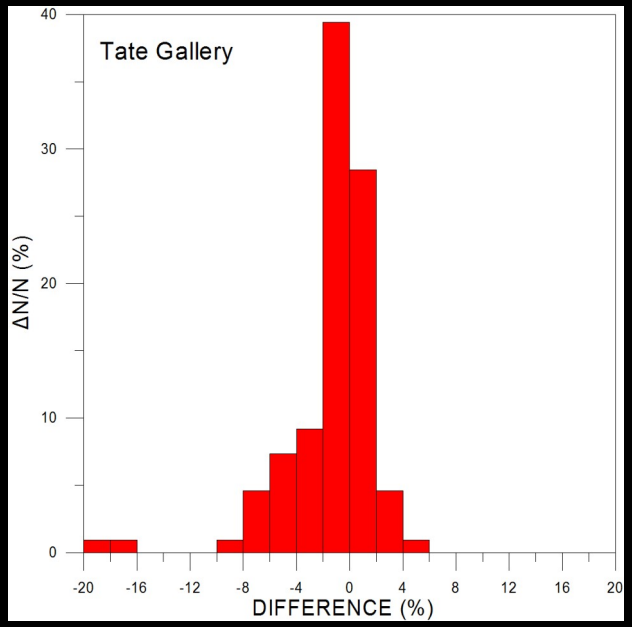


Aerosol optical depth from paintings and other proxy indices during the past 500 years from different proxies (Zerefos et. al., 2014)

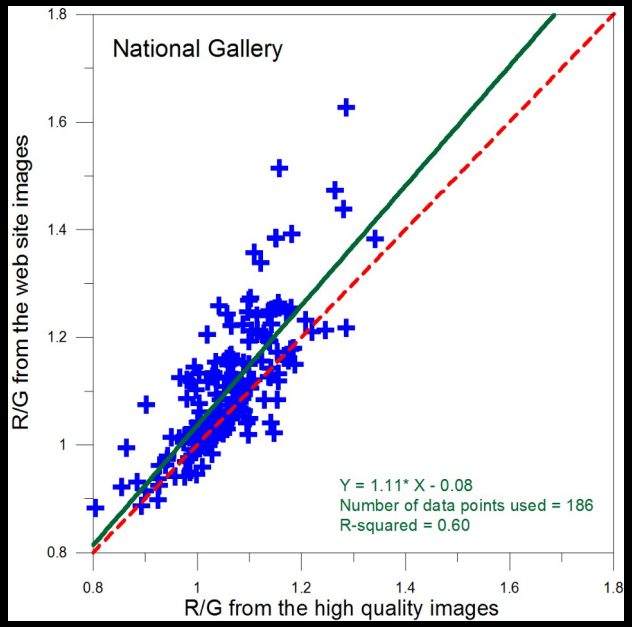
R/G ratios derived from painting digital images from website (low resolution) vs. R/G ratios for the same paintings obtained through colour profile protocol (high resolution) at the Tate Gallery.



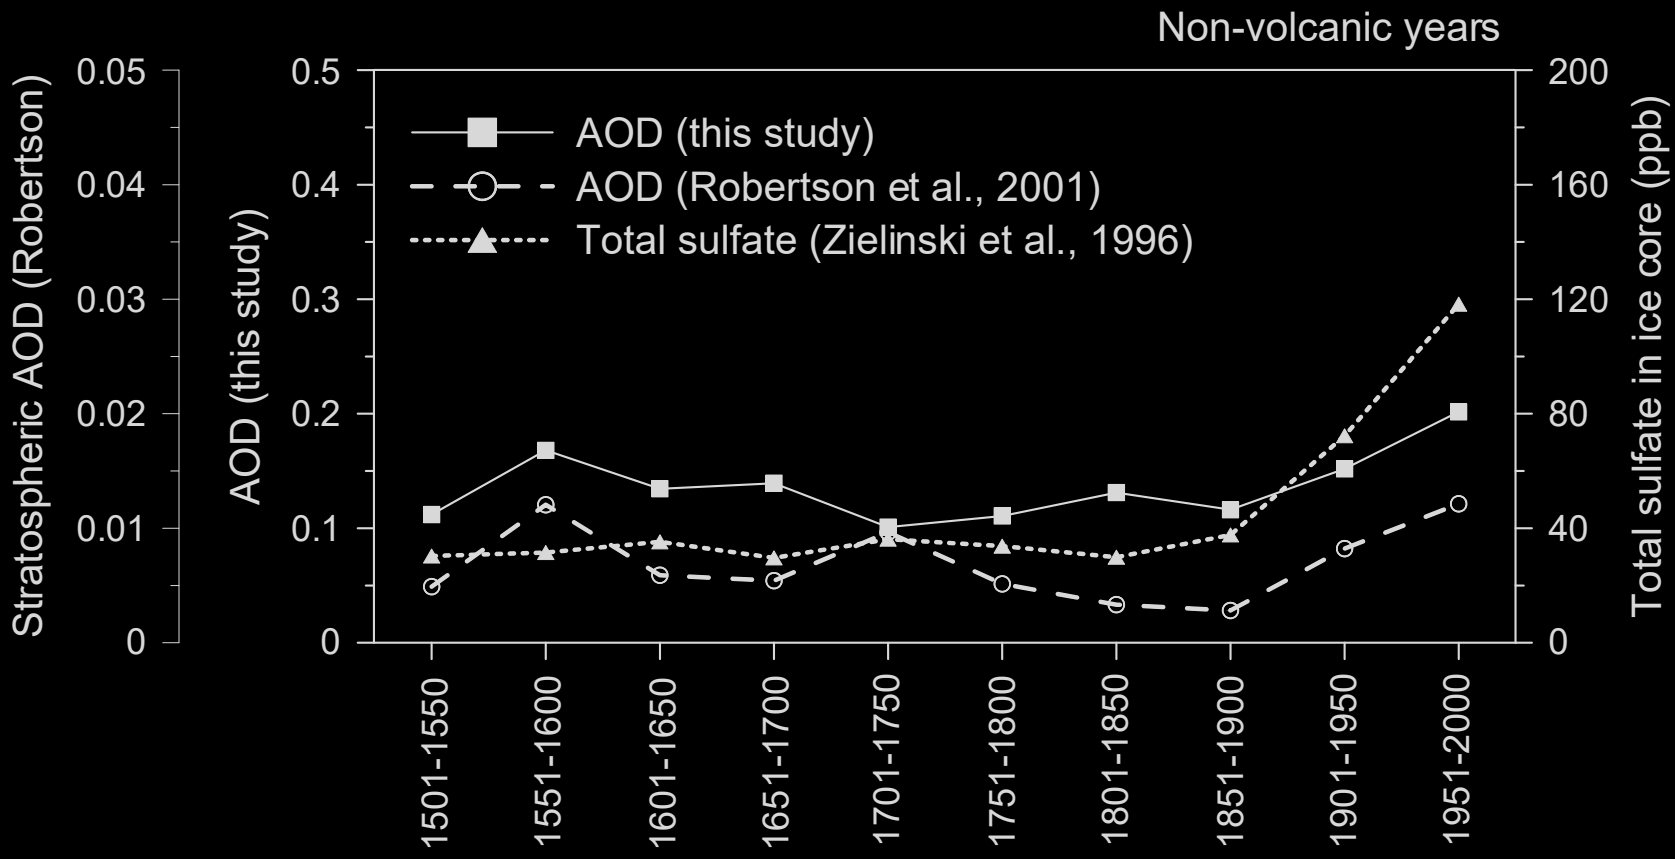
Distribution of the relative differences (in %) between the R/G ratios derived from the high- and the low-resolution images from 124 landscape sunsets at the Tate Gallery.



Results from a completely independent sample of paintings. R/G ratios derived from painting digital images from the website (low resolution) vs. the same R/G ratios from high resolution digital images at the National Gallery, London.



Atmospheric aerosols increased after the 19th century (Zerefos et. al., 2014)



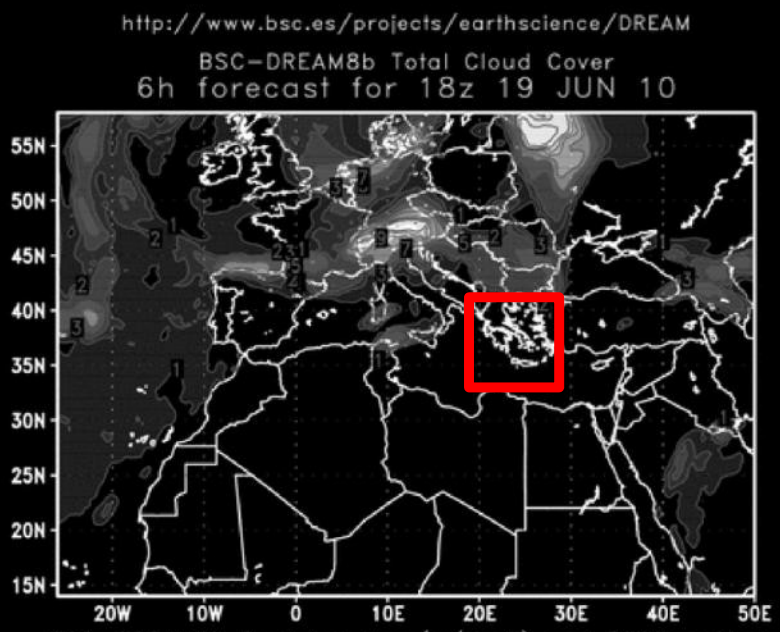
Correlation coefficients between volcanic aerosol indices and AOD proxies

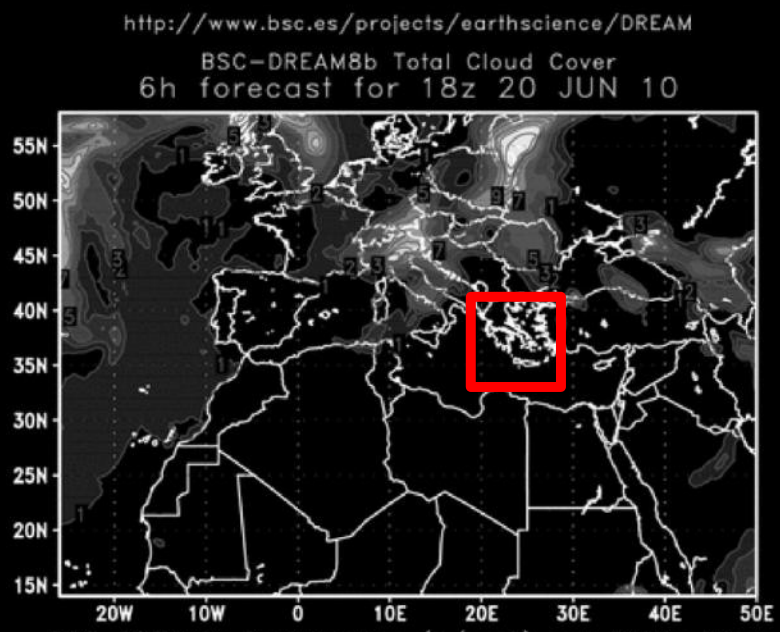
1500–2000	DVI	AOD (this study)	AOD (Robertson)	AOD (Crowley and Unterman)	AOD (Sato)	AOD (Stothers)	Sulfate (Gao)
DVI	1						
AOD (this study)	**0.85** [102]	1					
AOD (Robertson)	**0.65** [227]	**0.58** [118]	1				
AOD (Crowley and Unterman)	**0.57** [154]	**0.54** [74]	**0.80** [239]	1			
AOD (Sato)	**0.65** [66]	**0.55** [61]	**0.57** [126]	**0.91** [78]	1		
AOD (Stothers)	(*) [29]	(*) [21]	**0.83** [37]	(*) [29]	**0.92** [38]	1	
Sulfate (Gao)	(*) [23]	(*) [14]	**0.88** [33]	(*) [24]	(*) [11]	(*) [6]	1

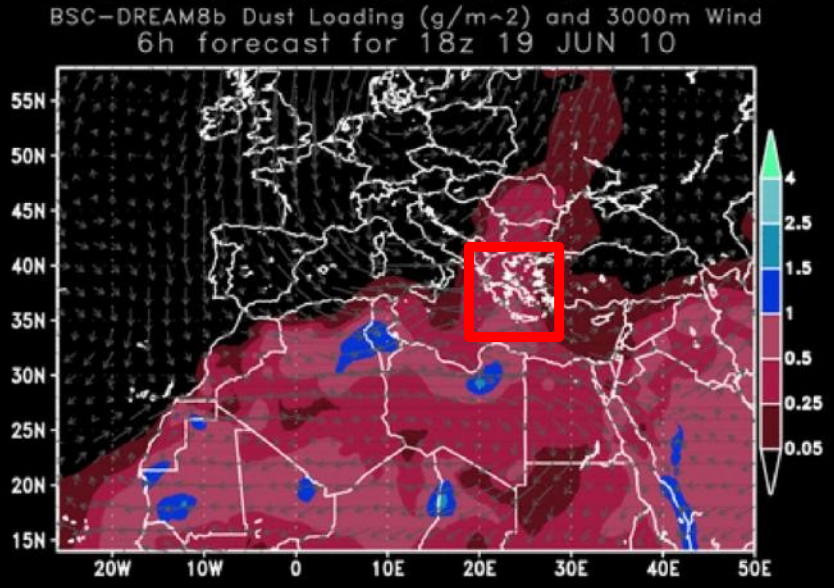
Bold: all the above correlations are significant at the 99 % confidence level (*t* test).
* missing correlations are those possessing less than 30 years of data.
In brackets: number of pairs.

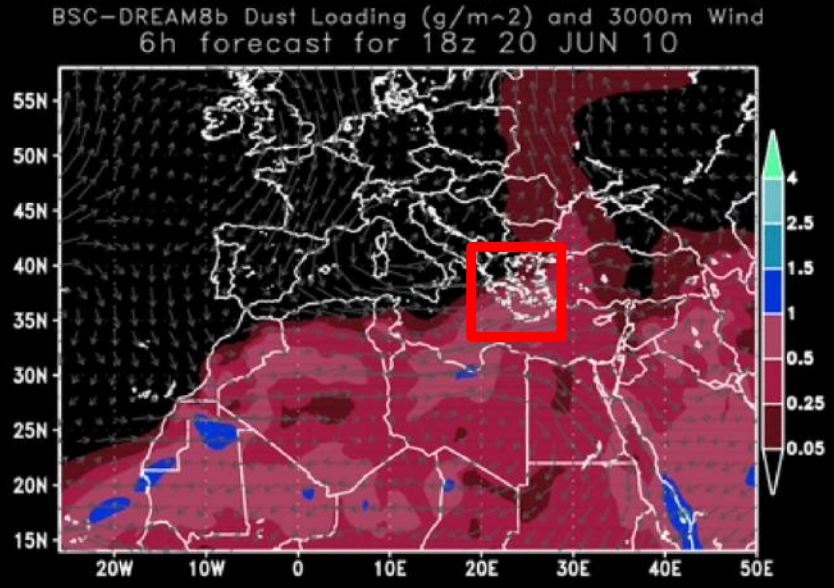
The experiment of Hydra island (19 & 20 June 2010)

Passage of a Saharan dust event

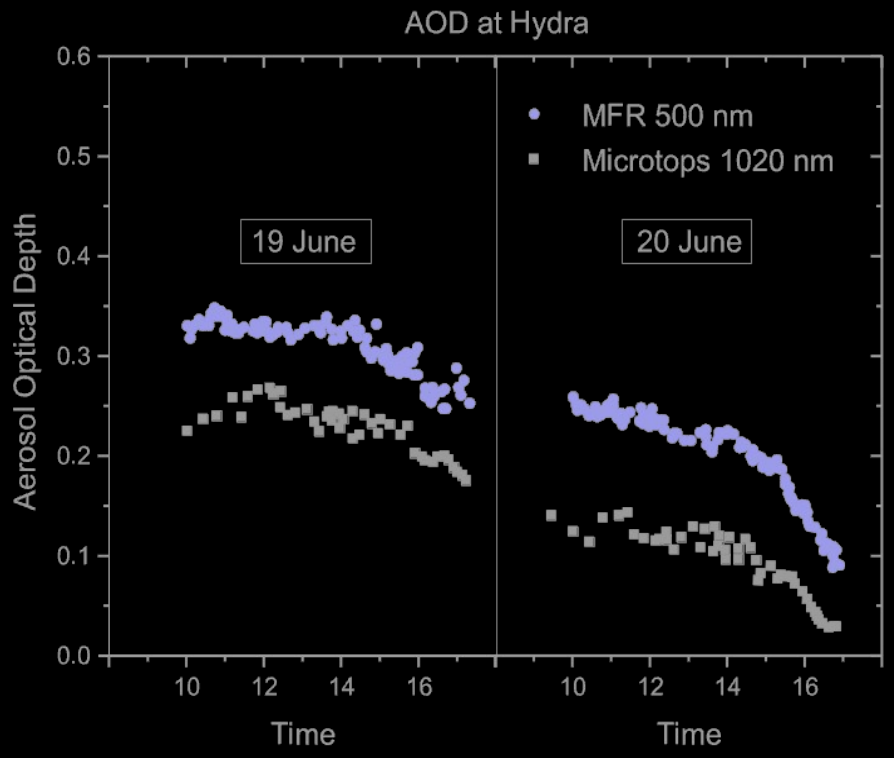




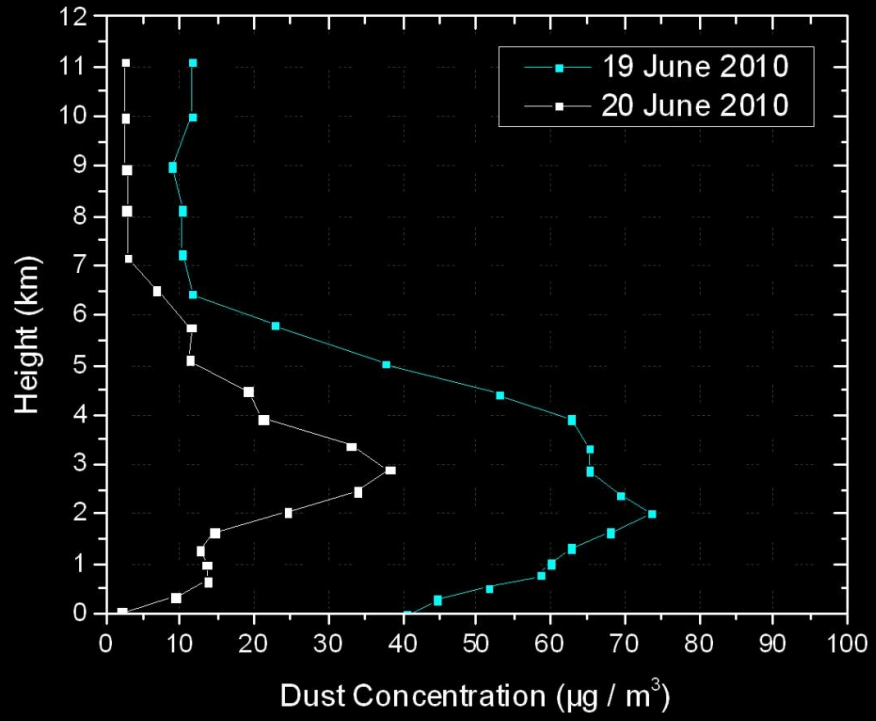




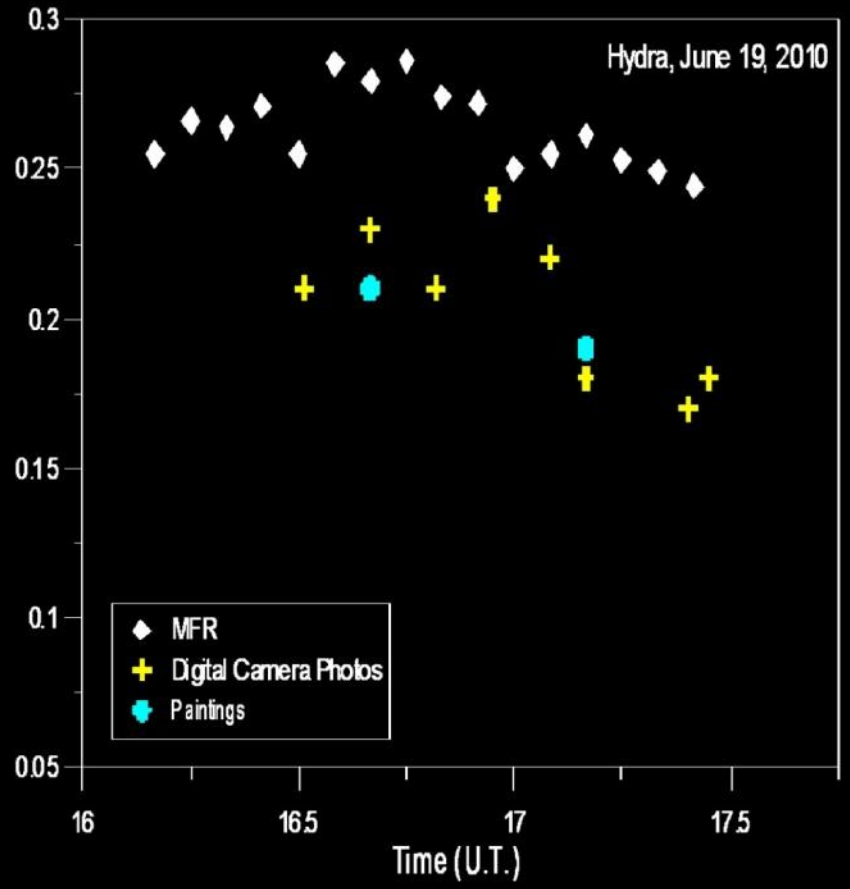
MFR-7 AOD retrievals at 500 nm on 19 and 20 June 2010 at Hydra campaign site. Microtops II AOD retrievals at 1020 nm are superimposed

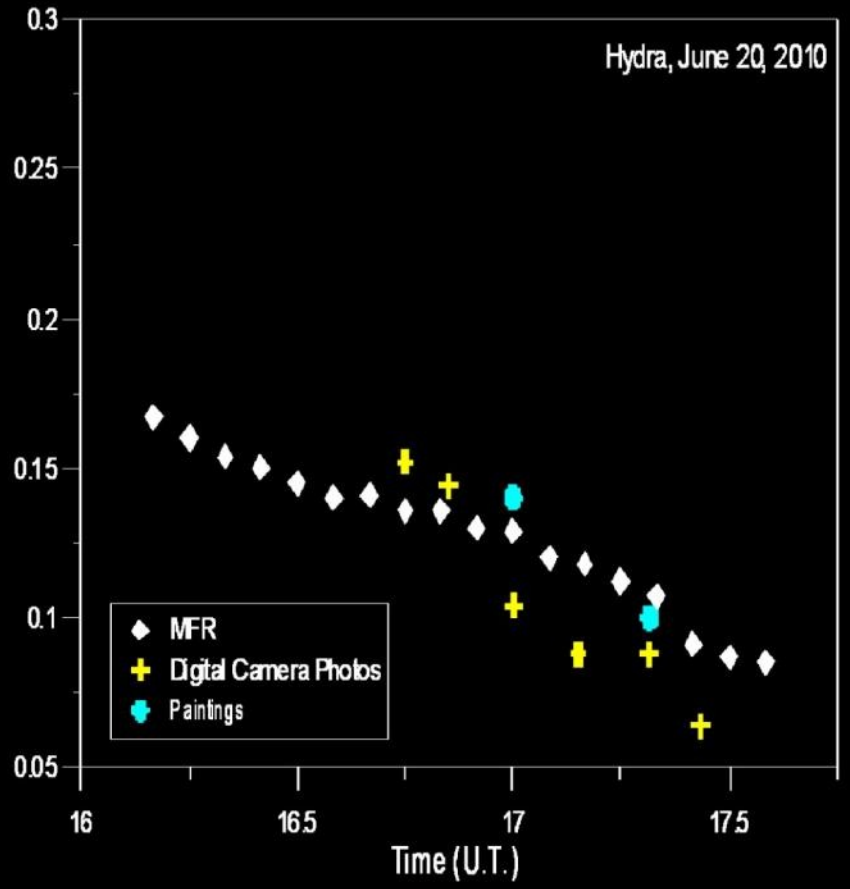


The profile of Saharan dust



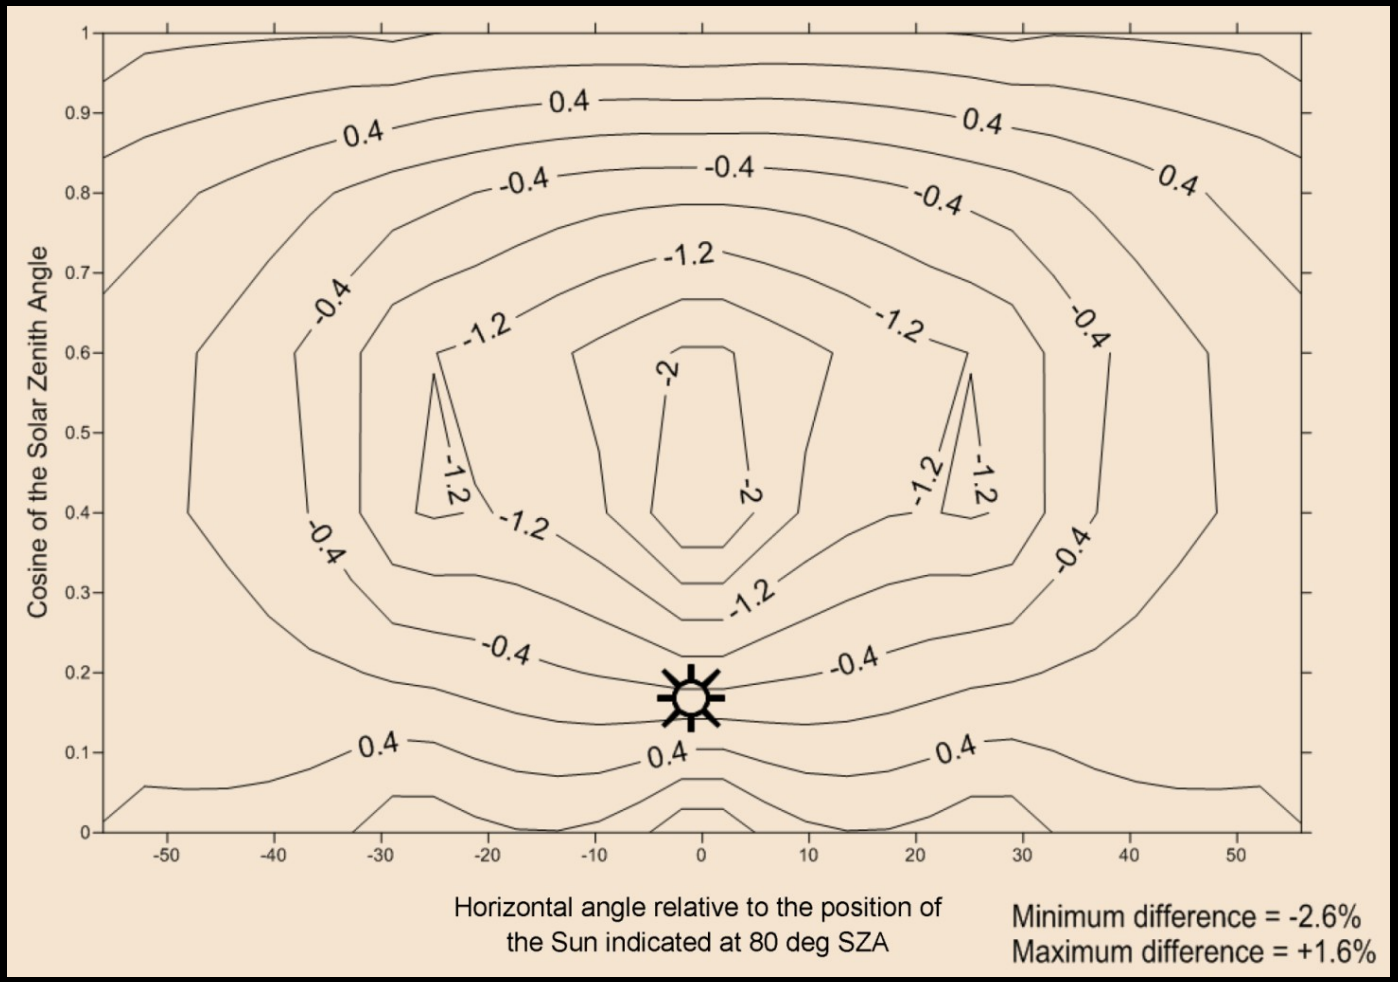
Aerosol measurements during the two days of the experiment



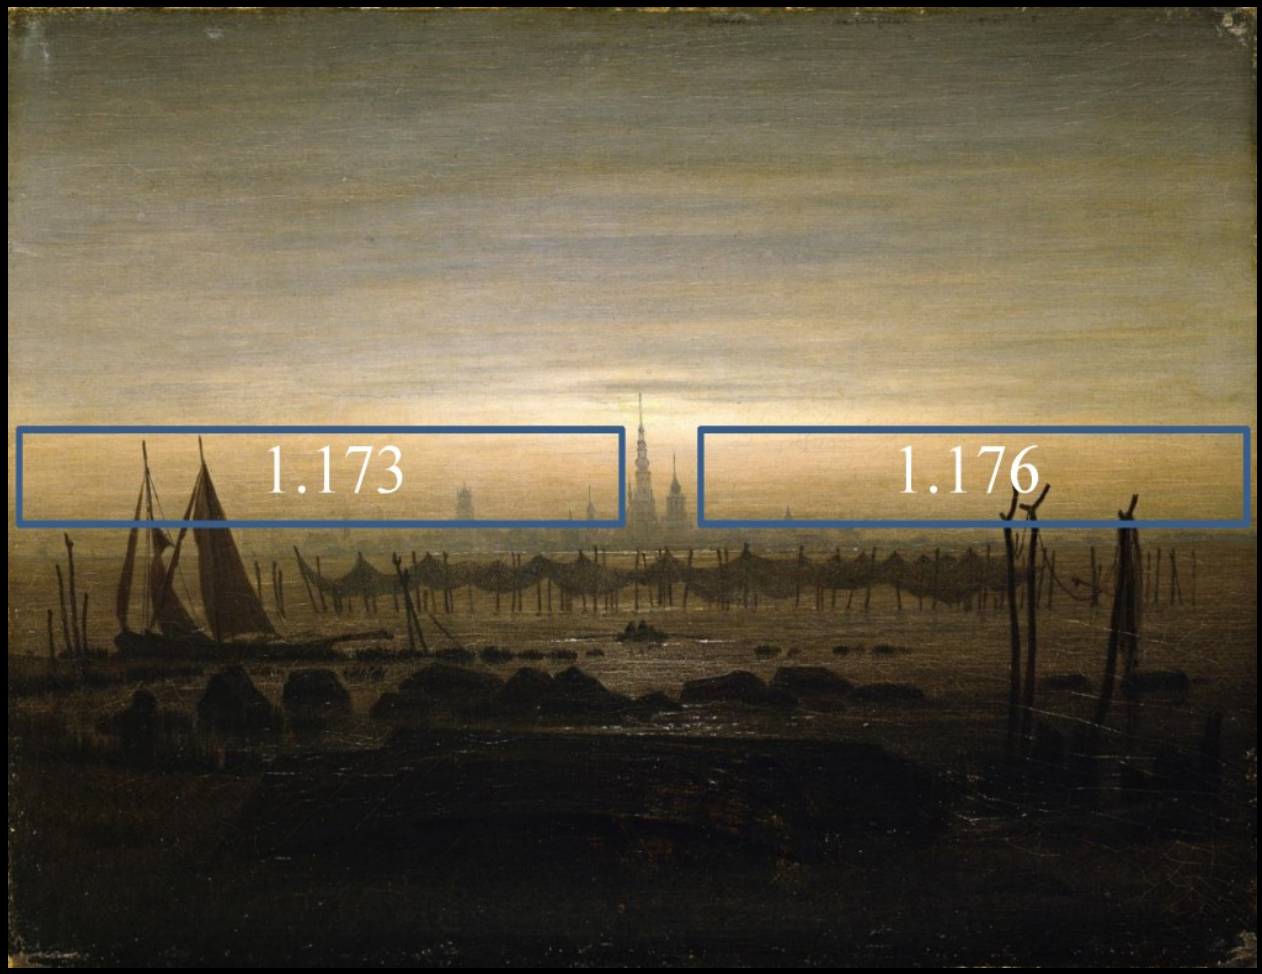


Upper: Digitally compressed paintings by P. Tetsis at the Hydra experiment under higher (left panel) and lower (right panel) AOD conditions. Bottom: Digital camera photos of the landscape.

Percent difference in R/G ratios between the measured at Hydra Sahara dust mineral aerosol profile and a typical modelled volcanic aerosol profile. In both cases AOD (500 nm) was set to 0.25.



R/G ratios with and without structural differences after Tambora (1815)



Caspar David Friedrich, Griefswald in the Moonlight, 1817.
Corresponding R/G ratios were averaged inside each box.

R/G ratios with and without structural differences after Tambora (1815)

Karl Friedrich Schinkel, The Banks of the Spree near Stralau, 1817.
Corresponding R/G ratios were averaged inside each box.

R/G ratios with and without structural differences after Tambora (1815)

- Monday October 1 2007

nature

RESEARCH HIGHLIGHTS

Volcanic paintings

Atmos. Chem. Phys. 7, 4027–4042 (2007)

The ash from large volcanic eruptions can cool Earth's climate and cause vividred sunsets. But the historical effects of volcanic activity on climate are difficult to quantify owing to a lack of direct atmospheric observation.

Christos Zerefos at the Academy of Athens in Greece and his colleagues have come up with a novel way to c particle content in middle latitudes isphere during the period 1500– sunsets captured in paintings by Mallord William Turner, Edgar Degas ictured is one of their subjects. *The* by Caspar David Friedrich.) lculated red/green colour ratios from dreds of paintings. They found that after major volcanic eruptions such in 1680 and 1883. The team then used to reconstruct how much light was nic ash in the air. The resulting time with and could complement existing tions of atmospheric composition.
